# 1 Introduction

GFI Archiver provides four web services to clients. These web services can be used to create tools that retrieve data from GFI Archiver.

The four available web services are:

Service	Description
Outlook Web Service	This web service can be used to perform similar functionality as the Outlook Connector. To consume the web service one must enter the URL of GFI Archiver followed by: <code>services\outlook.asmx</code> .
Send Web Service	This web service can be used to perform email restore operations. To consume the web service one must enter the URL of GFI Archiver followed by: <code>services\send.asmx</code> .
Search Web Service	This web service can be used to perform searches on the data within GFI Archiver. To consume the web service one must enter the URL of GFI Archiver followed by: <code>services\search.asmx</code> .
Store Web Service	This web service can be used to retrieve information about the archive stores within GFI Archiver. To consume the web service one must enter the URL of GFI Archiver followed by: <code>services\store.asmx</code> .

To use these web services through Microsoft Visual Studio, add a web reference to the solution with the URLs specified above, depending on which web service is required.

Once the web reference is added, the methods available in each referenced web service can be accessed. On the next page a snippet of how to use the Outlook web service can be found.

## 1.1 Code snippet example: Using Outlook web service

```
CookieContainer cookie = new CookieContainer();

Outlook outlookWS = new Outlook();
outlookWS.Url = "http://127.0.0.1/archiver/services/outlook.asmx";
outlookWS.Credentials = System.Net.CredentialCache.DefaultCredentials;
outlookWS.CookieContainer = cookie;

User user = outlookWS.Connect();
Console.WriteLine("Connected to Outlook WebService @ {0} with user {1}",
outlookWS.Url, user.DisplayName);

Console.WriteLine("Get list of MailBoxes to which I have access:");
User[] users = outlookWS.GetAllowedMailBoxes();

foreach (User allowedUser in users)
{
    Console.WriteLine("\n user name: {0}; login: {1}; user id: {2}",
        allowedUser.DisplayName, allowedUser.Name, allowedUser.UserId);
}
```

In the code snippet above, the Outlook web service has been referenced and the methods can be accessed. In this example, the URL and credentials are set to use windows authentication. Network credentials can be used by substituting the line:

```
outlookWS.Credentials = System.Net.CredentialCache.DefaultCredentials;
```

with the following:

```
outlookWS.Credentials = new NetworkCredential("user", "password",  
"domain");
```

When this change is made, the connection is tested and a user object is returned. The URL and display name of the user are displayed in the console window.

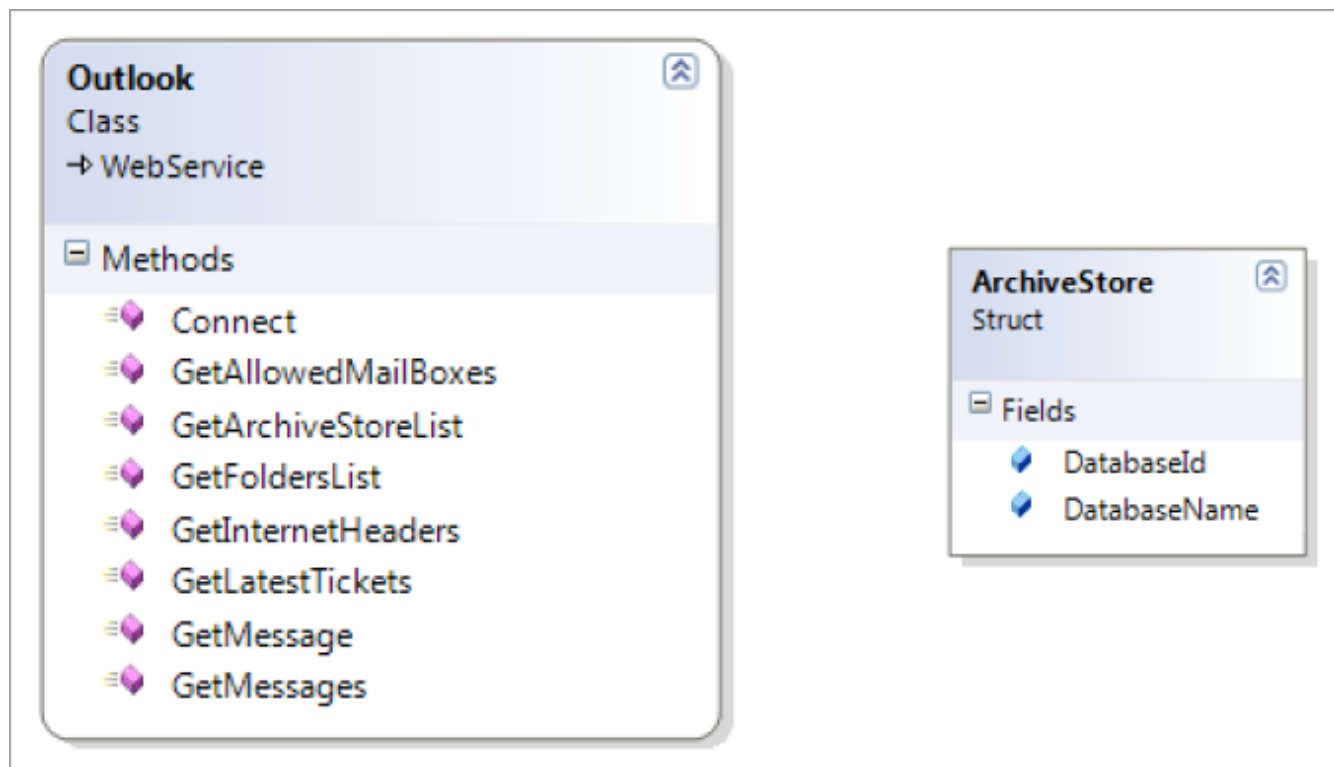

Once the user has been retrieved, the method `GetAllowedMailBoxes()` is called. This method returns a list of all the users that the current user has access too. Once the array of users is returned, a loop is performed to display all the users that the current user has access too.

To summarize, this snippet connects to the Outlook web service, confirms the connection and gets all the mailboxes that the current user has access too.

## 2 Outlook Service

The below section describes the Outlook web service. Each method is explained to get a better understanding of the service. To consume the web service one must enter the URL of GFI Archiver followed by: `services\outlook.asmx`.

### Class Diagrams

### Methods

Name	Description
<code>Connect</code>	Test connection and return current user details
<code>GetAllowedMailBoxes</code>	Get a list of mailboxes for all users to whom the current user has access
<code>GetArchiveStoreList</code>	Get a list of available database connections
<code>GetFolderList</code>	Get a list of folders for the given user
<code>GetInternetHeaders</code>	Get internet headers for the given message
<code>GetLatestTickets</code>	Used to return the latest timestamp for each database for the given user
<code>GetMessage</code>	Get Detailed Message, including body
<code>GetMessages</code>	Get cache updates

### 2.1 Connect

```
public MarUIHelper.User Connect ()
```

Description:

This method tests the connection with the current user details retrieved within the method. It gathers and returns a user with the details explained below.

Parameters: *None*

Return Value: [User](#)

## 2.2 GetAllowedMailBoxes

```
public MarUIHelper.User[] GetAllowedMailBoxes ()
```

Description:

This method gets all available mailboxes that the user has access to. For example, a user that is a member of the full access group will have access to all available mailboxes. If the user is set as a manager of a specific group, then the mailboxes that the manager has access to will be returned. In many instances, a user will only have access to his own mailbox and only that mailbox will be returned when this method is called.

Parameters: *None*

Return Value: [User\[\]](#)

## 2.3 GetArchiveStoreList

```
public ArchiveStore[] GetArchiveStoreList ()
```

Description:

This method gets all the available archive stores that are visible. If an archive store does not “**allow users to browse and search this archive store**” then it will not be added to the array of archive stores.

Parameters: *None*

Return Value: [ArchiveStores\[\]](#)

## 2.4 GetFoldersList

```
public MarUIHelper.Folder[] GetFoldersList(string userId)
```

Description:

This method returns an array of folders for the user guid supplied. The main purpose of this method is to create the folder list in the tree panel. This means that this method will return all the folders of the supplied user.

Parameters:

[string](#) userId - Guid of user

Return Value: [Folder\[\]](#)

## 2.5 GetInternetHeaders

```
public string GetInternetHeaders(string connectionId, int messageId)
```

Description:

This method returns a string with the internet header of the message supplied from the specified database. To summarize, this method returns a string containing the internet header for the given `connectionid` and `messageid`.

Parameters:

- » `string` connectionId - Database Guid
- » `int` messageId - Marc specific message id for required email

Return Value: `string` internet header

## 2.6 GetLatestTickets

```
public MarUIHelper.Ticket[] GetLatestTickets(string userId)
```

Description:

This method is used to return an array of `Ticket` that will contain all databases and their associated latest timestamp for the given user. This method is also used to retrieve the latest updates on messages. This can be done by comparing the timestamp returned in the `Ticket` with the timestamp cached on the client side.

Parameters: `string` userId - Guid of user

Return Value: `Ticket[]`

## 2.7 GetMessage

```
public MarUIHelper.WSDetailedMessage GetMessage(string connectionId, int messageId)
```

Description:

This method is used to return a detailed message from the database supplied. The message contains all the details regarding the message retrieved from the supplied `messageId`. This includes the body of the message and if the body is not found, it is returned as null.

Parameters:

- » `string` connectionId - Database guid
- » `int` messageId - Marc specific message id for required email

Return Value: `WSDetailedMessage`

## 2.8 GetMessages

```
public MarUIHelper.WSResultSet GetMessages(MarUIHelper.Ticket ticket, DateTime startDate, DateTime endDate, int maxCount)
```

Description:

This method is used for normal synchronization and bulk synchronization of the client's cache. It gets a number of updates such as new messages, changes in tags and deleted messages.

When this method is called with the `Ticket`, `startDate`, `endDate`, and `maxCount` parameters, a `ResultSet` object is returned consisting of four elements: **Ticket**, **New messages**, **Deleted messages** and **Tag updates**.

The **Ticket** is used to keep track of what is already downloaded by keeping the latest timestamp, the **New messages** contain information about new messages added, the **Deleted messages** contain information about the messages deleted and **Tag updates** contain information about a change, for example, adding a label to a message.

Parameters:

**Ticket** ticket - Database guid

**DateTime** startDate - Start date from when emails should be retrieved

**DateTime** endDate - End date

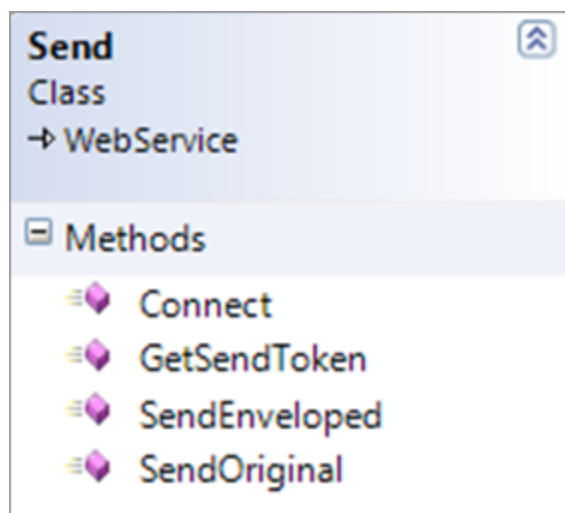

**int** maxCount - Maximum amount of update notifications ResultSet objects to be returned, this can be lower than the requested amount

Return Value: **WSResultSet**

## 3 Send Web Service

The following section describes the **Send Web Service**. Each method is explained to get a better understanding of the service. To consume the web service, enter the URL of GFI Archiver followed by: `services\send.asmx`.

### Class Diagrams

### Methods

Name	Description
Connect	Test connection and return string containing build number and version
GetSendToken	Generates a token for a continuous send operation
SendEnveloped	Restore email to mailbox in envelope (original as attachment)
SendOriginal	Restore email to mailbox in original format

### 3.1 Connect

```
public string Connect()
```

Description:

This method tests the connection by retrieving the product version and product build number.

Parameters: None

Return Value: `string`

### 3.2 GetSendToken

```
public Guid GetSendToken()
```

Description:

This method returns a guid that groups 'send operations' together. The guid will be used for a group of send operations. This token can be found in the cache. This method is required when performing a send operation.

Parameters: None

Return Value: [Guid](#)

### 3.3 SendEnveloped

```
public void SendEnveloped(string connectionGuid, int messageId, string recipientEmail, string key, Guid seqGuid)
```

Description:

This method is used to send an archived email to the user's mailbox as an attachment. It requires the database guid, the message id, the recipient's email, the key which contains the session sequence number and the session sequence number. The key is used to verify that the GetSendToken was called and a token is available in the cache.

Parameters:

- » [string](#) connectionGuid - database guid
- » [int](#) messageId - MArC specific message id for required email
- » [string](#) recipientEmail - email address of recipient
- » [string](#) key - contains sequence guid
- » [Guid](#) seqGuid - auditing session sequence number

Return Value: *None*

### 3.4 SendOriginal

```
public void SendOriginal(string connectionGuid, int messageId, string recipientEmail, string key, Guid seqGuid)
```

Description:

This method is used to send an archived email to the user's mailbox as the original message. It requires the database guid, the message id, the recipient's email, the key which contains the session sequence number and the session sequence number. The key is used to verify that the GetSendToken was called and a token is available in the cache.

Parameters:

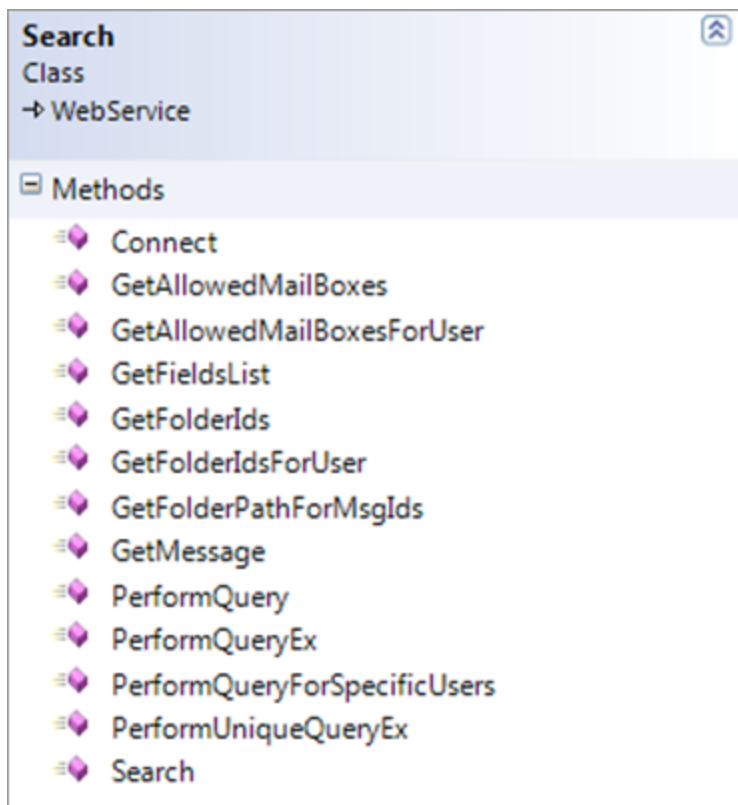

- » [string](#) connectionGuid - database guid
- » [int](#) messageId - MArC specific message id for required email
- » [string](#) recipientEmail - email address of recipient
- » [string](#) key - contains sequence guid
- » [Guid](#) seqGuid - auditing session sequence number

Return Value: *None*

## 4 Search Web Service

The following section describes the **Search Web Service**. Each method is explained to get a better understanding of the service. To consume the web service one must enter the URL of GFI Archiver followed by: `services\search.asmx`.

### Class Diagrams

Name	Description
Connect	Test connection and return string containing build number and version
GetAllowedMailBoxes	Get a list of mailboxes for all users to whom the current user has access
GetAllowedMailBoxesForUser	Get a list of mailboxes for all users to whom the current user has access filtering with string provided
GetFolderList	Get a list of supported fields (stub)
GetInternetHeaders	Get internet headers for the given message
GetLatestTickets	Used to return the latest timestamp for each database for the given user
GetFolderIds	Get folder ids for user calling the method
GetFolderIdsForUser	Get folder ids for a specific user
GetFolderPathForMsgIds	Gets the folder paths for Message Ids specified in MessageInfo class array
GetMessage	Get archived message headers
PerformQuery	Perform search query
PerformQueryEx	Perform extended search query
PerformQueryForSpecificUsers	Perform search query for specific list of userIds
PerformUniqueQueryEx	Perform extended search query with Unique ID

## 4.1 Connect

```
public string Connect()
```

Description:

This method tests the connection by retrieving the `ProductVersion` and `ProductBuild`.

Parameters: *None*

Return Value: `string`

## 4.2 GetAllowedMailBoxes

```
public MarUIHelper.User[] GetAllowedMailBoxes()
```

Description:

This method gets all the available mailboxes that the user has access to. For example, a user within the full access group can access all available mailboxes and if a user is set as manager of a specific group, then the mailboxes that the manager has access to are returned. In many situations a user will only have access to his own mailbox and only that mailbox is returned when this method is called.

Parameters: *None*

Return Value: `User[]`

## 4.3 GetAllowedMailBoxesForUser

```
public MarUIHelper.User[] GetAllowedMailBoxesForUser(string strUserSearch)
```

Description:

This method gets all the mailboxes for the specified user. Only mailboxes to which the user has access are returned. For example, if the word “John” is specified, all mailboxes that match “John” are returned if the current user has access to those mailboxes. This method is very similar to `GetAllowedMailBoxes` but instead it filters the results depending on the string passed as a parameter.

Parameters: `string` strUserSearch

Return Value: `User[]`

## 4.4 GetFieldsList

```
public IndexFields GetFieldsList()
```

Description:

This method returns a new instance of `IndexFields`. This is a list of supported fields such as attachment, body, owners and priority.

Parameters: *None*

Return Value: `IndexFields`

## 4.5 GetFolderIds

```
public string[] GetFolderIds(FolderOpt[] folderOptions)
```

Description:

This method is used to retrieve the IDs of the folders for the user calling the method. The method calls `GetFolderIdsForUser` passing two parameters, `FolderOpt[]` with the folder options which consists of the folder path and whether to search for subfolders and a string with the user guid. `GetFolderIdsForUser` will return an array of strings containing the folder ids.

Parameters: `FolderOpt[]` folderOptions

Return Value: `string[]`

## 4.6 GetFolderIdsForUser

```
public string[] GetFolderIdsForUser(FolderOpt[] folderOptions, string
userGuid)
```

Description:

This method is used to retrieve an array of strings containing the folder IDs of the folders for the required user. The `folderOptions` parameter contains the path of the folder and whether to check for subfolders.

Parameters: `FolderOpt[]` folderOptions

Return Value: `string[]`

## 4.7 GetFolderPathForMsgIds

```
public MarUIHelper.FolderPath[]
GetFolderPathForMsgIds(MarUIHelper.MessageInfo[] messagesInfo)
```

Description:

This method gets the folder paths for the message IDs supplied in the `MessageInfo` class array.

Also this method is used by the Bulk export tool search so that the `FolderPath` for particular messages can be obtained. The method is called with a `MessageInfo[]` class array with a list of messages containing the guid of the database, user and the message id. The folder path is then returned for each of these messages.

Parameters: `MessageInfo[]` messageInfo

Return Value: `FolderPath[]`

## 4.8 GetMessage

```
public Message GetMessage(string connectionId, int messageId, out string
messageUrl, out string sourceUrl)
```

Description:

This method gets the archived message headers. Using the `connectionId` (which is the database guid) and the `messageId` (which is the MArc specific message id for the required email) the information for the header can be retrieved. This information is then returned in a `Message` object. This message object contains information about the message such as size, owner, sent date, archived date and so on.

Parameters:

- » `string` connectionId - Database guid
- » `int` messageId - MArc specific message id for required email

- » `out string` `messageUrl` - contains link to mailview of email
- » `out string` `sourceUrl` - contains link to source of email

Return Value: [Message](#)

## 4.9 PerformQuery

```
public SearchEmailResults PerformQuery(SearchOptions parameters, out Guid seqNo)
```

Description:

This method performs a search query. When this method is called it is passed a `SearchOptions` object that contains all the information about the search. A `SearchEmailResults` object is returned with all the information regarding the results of the search performed with the `SearchOptions` object.

Parameters:

- » `SearchOptions` `parameters` - Contains information about search done by user
- » `out Guid` `seqNo` - auditing session sequence number

Return Value: [SearchEmailResults](#)

## 4.10 PerformQueryEx

```
public SearchEmailResults PerformQueryEx(SearchOptions parameters, string rawQuery, string xFilter, int limit, List<string> ownerids, out Guid seqNo)
```

Description:

This method performs an extended search query. It works the same as `PerformQuery` but instead it accepts raw search queries. These raw queries also accept filtering and limit the number of results returned.

Parameters:

- » `SearchOptions` `parameters` - Contains information about search done by user
- » `string` `rawQuery` - a raw search query
- » `string` `xFilter` - filter raw search query
- » `int` `limit` - number of emails
- » `List<string>` `ownerids` - list of guids of owners
- » `out Guid` `seqNo` - auditing session sequence number

Return Value: [SearchEmailResults](#)

## 4.11 PerformQueryForSpecificUsers

```
public SearchEmailResults PerformQueryForSpecificUsers(SearchOptions parameters, List<string> users, out Guid seqNo)
```

Description:

This method performs a search query for specific users. When this method is called it is passed a `SearchOptions` object that contains all the information about the search. A `SearchEmailResults` object is returned with all the information regarding the results of the search performed with the `SearchOptions` object.

Parameters:

- » `SearchOptions` parameters - Contains information about search done by user
- » `List<string>` users - list of guids of users
- » `out Guid` seqNo - auditing session sequence number

Return Value: `SearchEmailResults`

## 4.12 PerformUniqueQueryEx

```
public SearchEmailResults PerformUniqueQueryEx(SearchOptions parameters,  
List<string> ownerids, UniqueMessage uniqueMsg, out Guid seqNo)
```

Description:

This method performs an extended search query with unique ID, it works similar to `PerformQuery` but instead it accepts a `UniqueMessage` object. This object contains the database guid and the message ID. This is the identification code of the email.

Parameters:

- » `SearchOptions` parameters - Contains information about search done by user
- » `List<string>` ownerids - list of guids of owners
- » `UniqueMessage` uniqueMsg - contains database guid, message id and message type
- » `out Guid` seqNo - auditing session sequence number

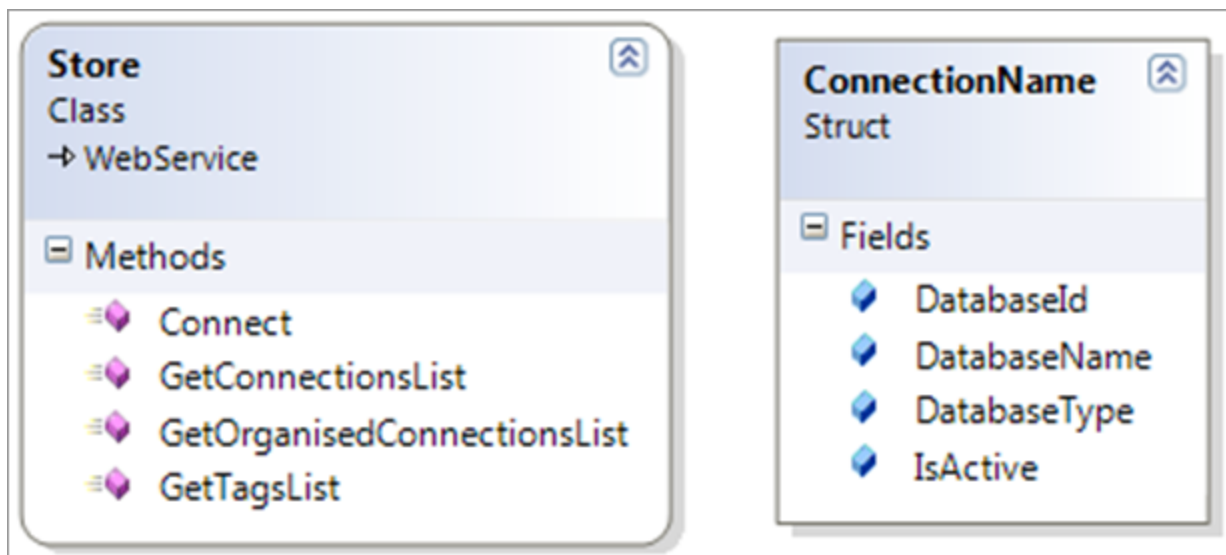

Return Value: `SearchEmailResults`

## 5 Store Web Service

The following section describes the **Store Web Service**. Each method is explained to get a better understanding of the service. To consume the web service enter the URL of GFI Archiver followed by: `services\store.asmx`.

### Class Diagrams

### Methods

Name	Description
<code>Connect</code>	Test connection and return string containing build number and version
<code>GetConnectionsList</code>	Get a list of available database connections
<code>GetOrganisedConnectionsList</code>	Get a list of available database connections organized in Active first and last entered afterwards
<code>GetTagsList</code>	Get a list of the current user's and retention tags

### 5.1 Connect

```
public string Connect()
```

Description:

This method tests the connection by retrieving the product version and product build number.

Parameters: *None*

Return Value: `string`

### 5.2 GetConnectionsList

```
public ConnectionName[] GetConnectionsList()
```

Description:

This method gets a list of all the databases. It returns an array of `ConnectionString` that contains, Database name, Database id, Database type and whether it is active or not.

Parameters: *None*

Return Value: `ConnectionString[]`

## 5.3 GetOrganisedConnectionsList

```
public ConnectionName[] GetOrganisedConnectionsList()
```

Description:

This method gets a list of all the databases organized in active first and last entered afterward. It returns an array of `ConnectionString` that contains, Database name, Database id, Database type and whether it is active or not.

Parameters: *None*

Return Value: `ConnectionString[]`

## 5.4 GetTagsList

```
public global::Store.Dal.Elements.Tag[] GetTagsList()
```

Description:

This method gets a list of all the retention tags set. It returns an array of a `Tag` object which contains the name, type and condition of each retention policy set.

Parameters: *None*

Return Value: `Tag[]`

## 6 Outlook Web Service Classes

Class	Description
<b>User</b>	This class contains information about a user. It contains the following properties: <ul style="list-style-type: none"><li>» <b>string</b> DisplayName - Active directory display name</li><li>» <b>string</b> UserId - Guid of user</li><li>» <b>string</b> Name - Active directory username</li></ul>
<b>Archive Store</b>	This class contains information about an archive store. It contains the following properties: <ul style="list-style-type: none"><li>» <b>string</b> DatabaseName - name of database</li><li>» <b>string</b> Databaseld - guid of database</li></ul>
<b>Folder</b>	This class contains information about a folder. Folders are stored as labels in Marc database terms, so that structure can be preserved. It contains the following properties: <ul style="list-style-type: none"><li>» <b>string</b> FolderId - Guid</li><li>» <b>string</b> FolderName - Guid</li></ul>
<b>Ticket</b>	This class contains information about a ticket. A ticket contains the following properties: <ul style="list-style-type: none"><li>» <b>long</b> Timestamp - Latest timestamp</li><li>» <b>long</b> CeilingTimeStam - timestamp that's set to Int64.MinValue when no more data is returned</li><li>» <b>string</b> UserId - guid of user</li><li>» <b>Guid</b> Databaseld - guid of database</li></ul>

Class	Description
<b>WSDetailedMessage</b>	<p>This class contains a number of properties that contain information about a message. It contains data such as the message id, archive date, Size and so on.</p> <p>The properties are described below:</p> <ul style="list-style-type: none"> <li>» <a href="#">WSAddress[]</a> AddressCollection - This property holds an array of <a href="#">WSAddress</a>.</li> <li>» <a href="#">DateTime?</a> ArchivedDate - This property contains the archived date of the message</li> <li>» <a href="#">Attachment[]</a> AttachmentCollection - This property holds and array of <a href="#">Attachment</a></li> <li>» <a href="#">WSBody</a> Body - This property holds a <a href="#">WSBody</a> object.</li> <li>» <a href="#">WSMessageDirection</a> Direction - This property holds an enum of <a href="#">WSMessageDirection</a>.</li> <li>» <a href="#">bool</a> Encrypted - bool describing whether the message is encrypted or not</li> <li>» <a href="#">string</a> InetMessageld - Contains a string with the mime internet message id</li> <li>» <a href="#">int</a> Messageld - Integer containing the message id</li> <li>» <a href="#">int</a> Priority - Integer containing priority of message</li> <li>» <a href="#">DateTime</a> ReceivedDate - Contains the received date of the message</li> <li>» <a href="#">DateTime</a> SentDate- Contains the sent date of the message</li> <li>» <a href="#">bool</a> Signed - Contains a bool whether the message is signed or not</li> <li>» <a href="#">int</a> Size - Integer with the size of the email</li> <li>» <a href="#">string</a> Subject - string containing the subject of message</li> <li>» <a href="#">WSTag[]</a> TagCollection - This property holds an array of <a href="#">WSTag</a></li> <li>» <a href="#">string</a> ThreadIndex - string containing the thread index of the message</li> <li>» <a href="#">string</a> ThreadTopic - string containing the thread topic of the message</li> <li>» <a href="#">long</a> TimeStamp - contains timestamp of message</li> </ul>
<b>WSAddress</b>	<p>This class contains information about a user's address and consists of three properties:</p> <ul style="list-style-type: none"> <li>» <a href="#">string</a> DisplayName - contains display name of user</li> <li>» <a href="#">string</a> Email - contains email address of user</li> <li>» <a href="#">WSAddressType</a> Type - enum of <a href="#">WSAddressType</a></li> </ul>
<b>WSAddressType</b>	<p>This is an enum that contains the following values:</p> <ul style="list-style-type: none"> <li>» From</li> <li>» To</li> <li>» CC</li> <li>» EFrom</li> <li>» ETo</li> <li>» EExportOwner</li> <li>» UnknownAddress</li> <li>» Sender</li> </ul>

Class	Description
WSMessageDirection	This is an enum that contains the following values: <ul style="list-style-type: none"> <li>» Imported</li> <li>» Internal</li> <li>» Inbound</li> <li>» Outbound</li> <li>» Mixed</li> <li>» Unknown</li> </ul>
Attachment	This class contains information the attachment and consists of five properties: <ul style="list-style-type: none"> <li>» <b>int</b> AttachmentId - contains attachment id</li> <li>» <b>string</b> ContentId - contains content id value of the attachment</li> <li>» <b>string</b> ContentLocation - contains attachment content location</li> <li>» <b>string</b> FileName - name of attachment</li> <li>» <b>int</b> Size - size of attachment</li> </ul>
WSBody	This class contains information about the body of the message and consists of three properties: <ul style="list-style-type: none"> <li>» <b>byte[]</b> BodyData - contains the message</li> <li>» <b>string</b> CharSet - contains character encoding</li> <li>» <b>BodyType</b> Type - enum of <b>BodyType</b>.</li> </ul>
BodyType	This is an enum that contains the following values: <ul style="list-style-type: none"> <li>» Txt</li> <li>» Html</li> <li>» Empty</li> </ul>
WSTag	This class contains information about the tags set on the message and consists of four properties: <ul style="list-style-type: none"> <li>» <b>string</b> FolderId - contains the id of the folder</li> <li>» <b>string</b> Name - contains the name of the tag</li> <li>» <b>WSTagType</b> Type - enum of <b>WSTagType</b></li> <li>» <b>string</b> Value - contains a string of the label set</li> </ul>
WSTagType	This is an enum that contains the following values: <ul style="list-style-type: none"> <li>» SystemTag</li> <li>» CustomTag</li> <li>» UserTag</li> <li>» None</li> </ul>

Class	Description
<b>WSResultSet</b>	<p>This class contains a number of properties that contain information about a Result set. It contains data such as Deleted messages, new messages, tag updates and ticket. The properties are described below:</p> <ul style="list-style-type: none"> <li>» <a href="#">WSDeletedMessage[] DeletedMessages</a> - This property holds an array of <a href="#">WSDeletedMessage</a>.</li> <li>» <a href="#">WSSimpleMessage[] NewMessages</a> - This property holds an array of <a href="#">WSSimpleMessage</a>.</li> <li>» <a href="#">WSTagUpdate[] TagUpdates</a> - This property holds an array of <a href="#">WSTagUpdate</a></li> <li>» <a href="#">Ticket Ticket</a> - This property holds a <a href="#">Ticket</a> object</li> </ul>
<b>WSDeletedMessage</b>	<p>This class contains information about a deleted message and consists of two properties:</p> <ul style="list-style-type: none"> <li>» <a href="#">int MessageId</a> - contains the id of the message</li> <li>» <a href="#">long TimeStamp</a> - contains the timestamp of the message</li> </ul>
<b>WSSimpleMessage</b>	<p>This class contains information about a message and consists of sixteen properties:</p> <ul style="list-style-type: none"> <li>» <a href="#">DateTime? ArchivedDate</a> - contains archive date of email</li> <li>» <a href="#">bool HasAttachments</a> - bool whether a message has an attachment</li> <li>» <a href="#">int MessageId</a> - int containing message id</li> <li>» <a href="#">int Priority</a> - int with priority of email</li> <li>» <a href="#">DateTime ReceivedDate</a> - contains received date of email</li> <li>» <a href="#">string Recipients</a> - contains a string of recipients</li> <li>» <a href="#">string Sender</a> - contains a string with the sender</li> <li>» <a href="#">string SenderName</a> - contains a string the name of the sender</li> <li>» <a href="#">DateTime SentDate</a> - contains the sent date of the message</li> <li>» <a href="#">int Size</a> - size of the message</li> <li>» <a href="#">string Subject</a> - subject of message</li> <li>» <a href="#">WSTag[] TagCollection</a> - This property holds an array of <a href="#">WSTag</a></li> <li>» <a href="#">string ThreadIndex</a> - string containing the thread index of the message</li> <li>» <a href="#">string ThreadTopic</a> - string containing the thread topic of the message</li> <li>» <a href="#">long TimeStamp</a> - contains timestamp of message</li> </ul>
<b>WSTagUpdate</b>	<p>This class contains information about the updates of tags and contains six properties:</p> <ul style="list-style-type: none"> <li>» <a href="#">string FolderId</a> - contains guid of folder</li> <li>» <a href="#">int MessageId</a> - contains message id</li> <li>» <a href="#">string TagName</a> - contains the name of the tag</li> <li>» <a href="#">WSTagType TagType</a> - Enum of <a href="#">WSTagType</a></li> <li>» <a href="#">string TagValue</a> - contains string with label set</li> <li>» <a href="#">long TimeStamp</a> - timestamp of label</li> </ul>

## 7 Search Web Service Classes

Class	Description
IndexFields	<p>This is a struct that contains information about the index fields. It contains the following constants:</p> <ul style="list-style-type: none"><li>» <code>const string ATTACHMENT = "attachment";</code></li><li>» <code>const string ATTACHMENTANDBODY = "attachmentandbody";</code></li><li>» <code>const string ATTACHMENTS_TEXT = "attachmentstext";</code></li><li>» <code>const string BCC = "bcc";</code></li><li>» <code>const string BODY = "body";</code></li><li>» <code>const string DBID = "marcdatabaseid";</code></li><li>» <code>const string HAS_ATTACHMENTS = "hasattachments";</code></li><li>» <code>const string MARCID = "marcid";</code></li><li>» <code>const int MAX_DISPLAYNAME_LEN = 50;</code></li><li>» <code>const int MAX_FIELDVAL_LEN = 250;</code></li><li>» <code>const string MSGDATE_FORMAT = "0000000000";</code></li><li>» <code>const string MSGID = "msgid";</code></li><li>» <code>const string MSGSIZE = "msgsize";</code></li><li>» <code>const string MSGSIZE_FORMAT = "0000000000";</code></li><li>» <code>const string MSGSIZE_KB = "msgsizekb";</code></li><li>» <code>const string OIDS = "oids";</code></li><li>» <code>const string OWNERS = "owners";</code></li><li>» <code>const string PRIMARYOID = "prioid";</code></li><li>» <code>const string PRIORITY = "priority";</code></li><li>» <code>const string RECVDATE = "rcvdate";</code></li><li>» <code>const string RECVDATE_DAYS = "rcvdated";</code></li><li>» <code>const string RECVDATE_SECONDS = "rcvdates";</code></li><li>» <code>const string SENDER = "sender";</code></li><li>» <code>const string SENTDATE = "sentdate";</code></li><li>» <code>const string SENTDATE_DAYS = "sentdated";</code></li><li>» <code>const string SENTDATE_SECONDS = "sentdates";</code></li><li>» <code>const string SUBJECT = "subject";</code></li><li>» <code>const string SUBJECT_DISPLAY = "subjectd";</code></li><li>» <code>const string THREAD_ID = "threadid";</code></li><li>» <code>const string TO = "to";</code></li><li>» <code>const string XML_SENDER = "xmlsender";</code></li><li>» <code>const string XML_TO = "xmlto";</code></li></ul>

Class	Description
FolderOpt	This class contains information about the options of a folder and has the following properties: <ul style="list-style-type: none"> <li>» <a href="#">bool</a> boolSearchSubFolders - whether to search subfolders or not</li> <li>» <a href="#">string</a> strFolderPath - path of the folder</li> </ul>
FolderPath	This class contains information about the folder. It contains the following properties: <ul style="list-style-type: none"> <li>» <a href="#">string</a> Path - contains path</li> <li>» <a href="#">string</a> Type - contains type of folder</li> </ul>
MessageInfo	This class contains information about a message. It contains the following properties: <ul style="list-style-type: none"> <li>» <a href="#">guid</a> Connectionid - Guid of database</li> <li>» <a href="#">int</a> messageid - Marc specific message id for required email</li> <li>» <a href="#">string</a> userid - user guid</li> </ul>
Message	This class contains detailed information about a message. It contains the following properties: <ul style="list-style-type: none"> <li>» <a href="#">Address[]</a> AddressCollection - Contains an array of <a href="#">Address</a>.</li> <li>» <a href="#">DateTime</a> ArchivedDate - archived date of message</li> <li>» <a href="#">Attachment[]</a> AttachmentCollection - Contains an array of <a href="#">Attachment</a></li> <li>» <a href="#">string</a> DuplicateThreadIndex - string with duplicate thread index</li> <li>» <a href="#">bool</a> Encrypted - whether message is encrypted or not</li> <li>» <a href="#">string</a> InetMessageld - Contains a string with the mime internet message id</li> <li>» <a href="#">int</a> Messageld - int with message id</li> <li>» <a href="#">Owner[]</a> OwnersCollection - Contains an array of <a href="#">Owner</a></li> <li>» <a href="#">int</a> ParentId - int of parent id</li> <li>» <a href="#">int</a> Priority - int containing priority</li> <li>» <a href="#">DateTime</a> ReceivedDate - received date of message</li> <li>» <a href="#">string</a> RuleId - id of rule applied to message</li> <li>» <a href="#">DateTime</a> SentDate - sent date of message</li> <li>» <a href="#">bool</a> Signed - bool whether message is signed or not</li> <li>» <a href="#">int</a> Size - size of message</li> <li>» <a href="#">string</a> Subject - subject of message</li> <li>» <a href="#">int</a> ThreadId - int thread id</li> <li>» <a href="#">long</a> TimeStamp - timestamp of message</li> </ul>
Address	This class contains information about a user's address and consists of three properties: <ul style="list-style-type: none"> <li>» <a href="#">string</a> DisplayName - contains display name of user</li> <li>» <a href="#">string</a> Email - contains email address of user</li> <li>» <a href="#">AddressType</a> Type - enum of <a href="#">AddessType</a></li> </ul>

Class	Description
AddressType	<p>This is an enum that contains the following values:</p> <ul style="list-style-type: none"> <li>» From</li> <li>» To</li> <li>» CC</li> <li>» EFrom</li> <li>» ETo</li> <li>» EExportOwner</li> <li>» UnknownAddress</li> <li>» Sender</li> </ul>
Attachment	<p>This class contains information the attachment and consists of five properties:</p> <ul style="list-style-type: none"> <li>» <code>int</code> AttachmentId - contains attachment id</li> <li>» <code>string</code> ContentId - contains content id value of the attachment</li> <li>» <code>string</code> ContentLocation - contains attachment content location</li> <li>» <code>string</code> FileName - name of attachment</li> <li>» <code>int</code> Size - size of attachment</li> </ul>
Owner	<p>This class contains information about the owners of the message and contains the following properties:</p> <ul style="list-style-type: none"> <li>» <code>bool</code> IsPrimary - bool whether owner is primary</li> <li>» <code>string</code> Name - name of owner</li> <li>» <code>AddressType</code> Type - enum of <code>AddressType</code></li> <li>» <code>string</code> UserName - username of owner</li> </ul>
SearchEmailResults	<p>This class contains information about the result of a search. It contains the following properties:</p> <ul style="list-style-type: none"> <li>» <code>bool</code> Done - bool whether search is done or not</li> <li>» <code>long</code> Hitcount - the amount of hits</li> <li>» <code>List&lt;SimpleMessage&gt;</code> Hits - list of <code>SimpleMessage</code></li> <li>» <code>string</code> Q - query string</li> <li>» <code>bool</code> SearchInAttachmentSupported - bool whether searching in attachments is supported</li> <li>» <code>bool</code> ThresholdReached - bool whether the threshold is reached</li> </ul>

Class	Description
<a href="#">SimpleMessage</a>	<p>This class contains information about a message. It contains the following properties:</p> <ul style="list-style-type: none"> <li>» <a href="#">Guid</a> Databaseld - database guid</li> <li>» <a href="#">bool</a> HasAttachments - whether email has an attachment or not</li> <li>» <a href="#">int</a> MarcId - mailarchiver message id</li> <li>» <a href="#">string</a> MsgID - message id of message</li> <li>» <a href="#">string</a> Recipients - recipients of message</li> <li>» <a href="#">DateTime</a> RecvDate - received date of message</li> <li>» <a href="#">string</a> Sender - sender of message</li> <li>» <a href="#">DateTime</a> SentDate - sent date of message</li> <li>» <a href="#">int</a> Size - size of message</li> <li>» <a href="#">string</a> Subject - subject of message</li> </ul>
<a href="#">SearchOptions</a>	<p>This class contains information about the search options. It consists of the following properties:</p> <ul style="list-style-type: none"> <li>» <a href="#">bool</a> Ascending - bool whether ascending or not</li> <li>» <a href="#">List&lt;string&gt;</a> DBIds - list of database ids</li> <li>» <a href="#">List&lt;FieldOpt&gt;</a> Fields - list of <a href="#">FieldOpt</a></li> <li>» <a href="#">int</a> HitOffset - page offset</li> <li>» <a href="#">int</a> HitsPerPage - number of hits per page</li> <li>» <a href="#">List&lt;RangeFieldOpt&gt;</a> RangeFields - list of <a href="#">RangeFieldOpt</a></li> <li>» <a href="#">bool</a> RestrictSearch - whether it is a restricted search or not</li> <li>» <a href="#">Search.Meta.SearchQuery</a> SearchQuery - <a href="#">SearchQuery</a></li> <li>» <a href="#">bool</a> Sort - whether to sort or not</li> <li>» <a href="#">string</a> SortField - which field to sort</li> </ul>
<a href="#">FieldOpt</a>	<p>This class is used for the field option set in the search. It consists of the following properties:</p> <ul style="list-style-type: none"> <li>» <a href="#">booleanflag_t</a> boolop - enum <a href="#">booleanflag_t</a></li> <li>» <a href="#">string</a> fieldname - fieldname set</li> <li>» <a href="#">string</a> query - query set</li> </ul>
<a href="#">booleanflag_t</a>	<p>This is an enum that contains the following values:</p> <ul style="list-style-type: none"> <li>» Null</li> <li>» AND</li> <li>» ANDNOT</li> <li>» OR</li> </ul>

Class	Description
RangeFieldOpt	<p>This class is used for the field options that have a range such as date and message size. It consists of the following properties:</p> <ul style="list-style-type: none"> <li>» <code>booleanflag_t</code> boolop - enum <code>booleanflag_t</code></li> <li>» <code>long</code> end - end value</li> <li>» <code>string</code> fieldname - field name set</li> <li>» <code>long</code> start - start value</li> </ul>
Search.Meta.SearchQuery	<p>This class is used for searches within folders and labels and consists of the following properties:</p> <ul style="list-style-type: none"> <li>» <code>string[]</code> Folders - list of folders</li> <li>» <code>string[]</code> NotFolders - list of excluded folders</li> <li>» <code>Tag[]</code> NotTags - list of excluded tags</li> <li>» <code>bool</code> Or - bool whether the OR operator is used</li> <li>» <code>Tag[]</code> Tags - list of tags</li> </ul>
Tag	<p>This class contains information about the tags available. It consists of the following properties:</p> <ul style="list-style-type: none"> <li>» <code>string</code> Name - name of tag</li> <li>» <code>TagType</code> Type - enum of <code>TagType</code></li> <li>» <code>string</code> Value - value of tag</li> <li>» <code>int</code> CompareTo(<code>Tag</code> other) - used to compare tags</li> <li>» <code>bool</code> Equals(<code>Tag</code> other) - used to check is tags are the same</li> </ul>
TagType	<p>This is an enum that contains the following values:</p> <ul style="list-style-type: none"> <li>» SystemTag</li> <li>» CustomTag</li> <li>» UserTag</li> <li>» None</li> </ul>
UniqueMessage	<p>This class contains information about a message. It contains the following properties:</p> <ul style="list-style-type: none"> <li>» <code>string</code> DBid - contains the database guid</li> <li>» <code>int</code> Messageld - contains message id</li> <li>» <code>MessageType</code> MessageType - enum of <code>MessageType</code></li> </ul>
MessageType	<p>This is an enum that contains the following values:</p> <ul style="list-style-type: none"> <li>» EML</li> <li>» FAX</li> </ul>

## 8 Store Web Service

Class	Description
<b>ConnectionString</b>	This struct is used for connection details. It contains the following properties: <ul style="list-style-type: none"><li>» <code>string</code> DatabaseName - Name of database</li><li>» <code>string</code> DatabaseId - Guid of database</li><li>» <code>DatabaseType</code> DatabaseType - enum of <code>DatabaseType</code></li><li>» <code>bool</code> IsActive - whether database is active or not</li></ul>
<b>DatabaseType</b>	This is an enum that contains the following values: <ul style="list-style-type: none"><li>» Access</li><li>» MsSql</li><li>» MySq</li><li>» FS</li><li>» None</li><li>» FireBird</li><li>» Marc3</li></ul>
<b>Store.Dal.Elements.Tag</b>	This class contains information about a tag. It consists of the following parameters: <ul style="list-style-type: none"><li>» <code>string</code> Name - Name of tag</li><li>» <code>TagType</code> Type - enum of <code>TagType</code></li><li>» <code>string</code> Value - condition</li></ul>
